Order-to-Cash (O2C) Process in SAP SD

Capstone Project Report

Student Name	Samridhi Sinha
Roll Number	23051535
Program	B.Tech in Computer Science & Engineering
Batch	2023-2027
Company (Fictitious)	NovaTrade Solutions Pvt. Ltd.
Tool / Platform	SAP S/4HANA — Sales & Distribution (SD)
Submission Date	21 April, 2026

KIIT School of Computer Engineering | Capstone Project Submission 2026

1. Problem Statement

In today's competitive business environment, managing the complete sales cycle from receiving a customer order to collecting payment is one of the most critical and complex operations for any organization. Without an integrated system, companies face challenges such as delayed order processing, poor inventory visibility, billing errors, revenue leakage, and lack of real-time reporting.

NovaTrade Solutions Pvt. Ltd., a fictitious mid-sized trading company dealing in electronic goods faced these exact challenges. The absence of a unified platform meant that sales, warehouse, finance, and customer service teams operated in silos, leading to customer dissatisfaction and revenue loss.

This project documents the simulation and documentation of O2C process using SAP S/4HANA Sales and Distribution (SD) module to streamline and integrate NovaTrade's entire sales cycle end-to-end.

2. Solution Overview & Key Features

The Order-to-Cash (O2C) process in SAP SD covers the complete journey of a sales transaction starting from a customer inquiry, through order creation, delivery, billing, and ending with payment receipt and accounting entry. The SAP SD module integrates seamlessly with MM (Materials Management) and FI (Financial Accounting) modules, ensuring end-to-end visibility.

Key Features of the O2C Implementation:

	Feature	Benefit
1	**Automated Sales Order Processing**	Reduced manual errors and faster order turnaround
2	**Real-time Inventory Check**	Prevents overselling; links to MM module
3	**Delivery & Goods Issue Tracking**	Full visibility of warehouse operations
4	**Automated Invoice Generation**	Accurate, timely billing with no revenue leakage
5	**FI Integration for Payment Posting**	Automatic accounting entries on payment receipt
6	**Customer Credit Management**	Risk control via credit limit checks in SAP

3. Tech Stack

Component	Details
ERP Platform	SAP S/4HANA
Primary Module	SAP SD (Sales & Distribution) (Integrated with MM & FI)
Integrated Modules	SAP MM (Materials Management), SAP FI (Financial Accounting)
Key Transactions Used	VA11, VA21, VA01, VL01N, VL02N, VF01, F-28
Master Data	Customer Master, Material Master, Pricing Condition Records
Organizational Structure	Sales Organization, Distribution Channel, Division, Plant
Document Types	Sales Order (OR), Delivery (LF), Billing Document (F2)

4. O2C Process — Step-by-Step Documentation

The following documents the complete Order-to-Cash cycle as configured for NovaTrade Solutions Pvt. Ltd. in SAP S/4HANA. Each step includes the SAP transaction code, the action performed, and the resulting document generated.

Step 1: Customer Inquiry & Quotation T-Code: VA11 / VA21

The process begins when a customer expresses interest in purchasing electronic goods.The sales representative creates an Inquiry (Transaction VA11) to record the customer's requirements. A formal Quotation is then created (VA21) with pricing details, validity period, and delivery terms. This is sent to the customer for approval.

Step 2: Sales Order Creation T-Code: VA01

Once the customer confirms the quotation, a Sales Order is created using Transaction VA01. The sales order is created with reference to the approved quotation. The sales order captures all critical details: customer code, material number, quantity, price, requested delivery date, payment terms, and shipping point. SAP automatically performs a credit check against the customer's credit limit and checks material

availability (ATP : Available-to-Promise) in real time. The system assigns a unique Sales Order number.

Step 3: Delivery Processing — T-Code: VL01N / VL02N

After the sales order is saved, the warehouse team creates an Outbound Delivery using Transaction VL01N. The delivery document references the sales order and confirms the items to be shipped. The warehouse team then picks the goods (physical collection from storage location) and records this in the system via VL02N (picking confirmation). A Transfer Order may be created if Warehouse Management (WM) is active.

Step 4: Goods Issue (GI) — T-Code: VL02N-PGI

Goods Issue is the most critical warehouse step. Using Transaction VL02N, the system posts the Goods Issue, which means ownership of the goods is legally transferred from NovaTrade to the customer. This triggers an automatic inventory reduction in SAP MM and creates a material document. The accounting entry generated is: Debit — Cost of Goods Sold (COGS); Credit — Inventory Account. Stock levels are updated in real time.

Step 5: Billing / Invoice Creation — T-Code: VF01

After the Goods Issue is posted, the billing department creates a Customer Invoice using Transaction VF01. SAP automatically pulls all relevant data (customer, materials, quantities, prices, taxes) from the delivery document. The invoice (Billing Document Type F2) is generated and sent to the customer. The FI integration automatically creates an accounting document: Debit — Accounts Receivable (Customer); Credit — Sales Revenue Account.

Step 6: Payment Receipt & Clearing — T-Code: F-28

The final step is recording the customer's payment. When NovaTrade receives payment, the accounts team posts an Incoming Payment using Transaction F-28. The payment is matched against the open invoice (clearing). The accounting entry is: Debit — Bank Account; Credit — Accounts Receivable. Once cleared, the O2C cycle is complete and the customer's account shows zero balance for this transaction.

5. O2C Process Flow Summary

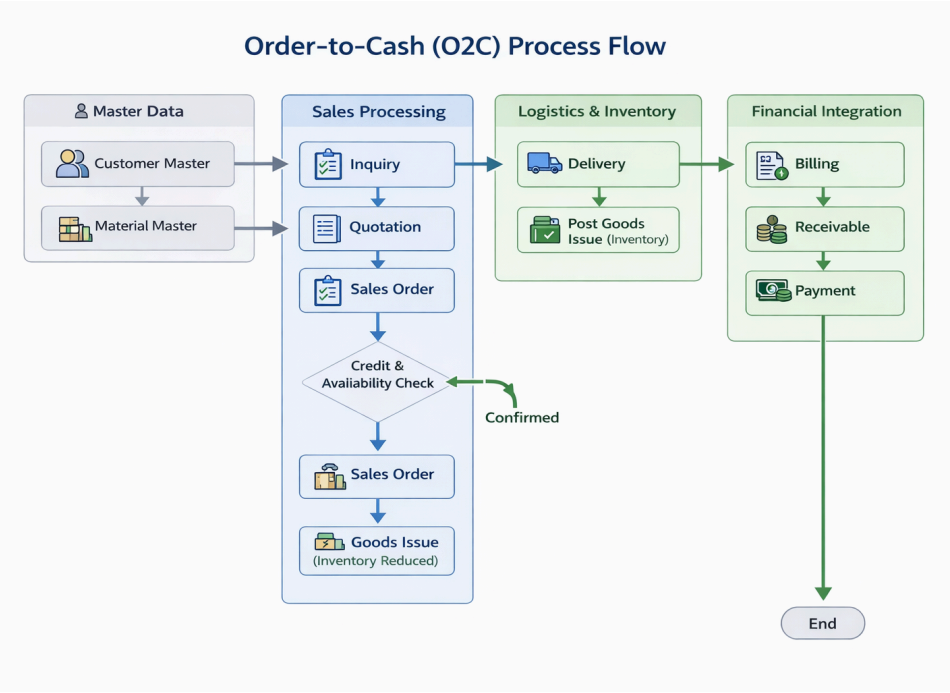

Fig 1: Detailed O2C Process with SAP SD–MM–FI Integration

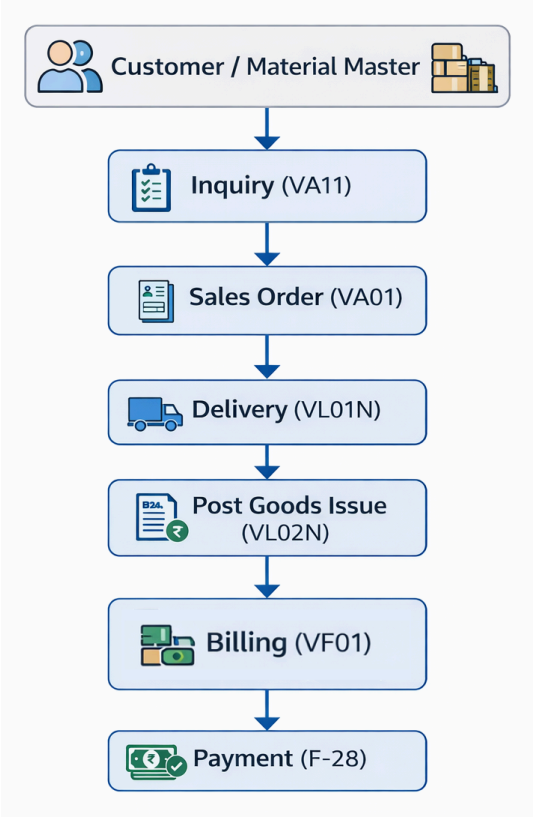

Fig 2: Order-to-Cash (O2C) Process Flow Overview

6. Screenshots of O2C Process (Illustrative)

The following screenshots represent a simulated user interface developed to demonstrate the SAP O2C process flow.

7. Unique Points of This Project

Real Business Scenario: The project is modeled on a realistic trading company (NovaTrade Solutions) dealing in electronic goods, making the O2C flow practically relevant and industry-applicable.

Full Module Integration: The process demonstrates integration across three SAP modules SD, MM, and FI showing how a single sales transaction affects inventory, revenue, and accounting simultaneously.

Transaction-Level Detail: Every step is mapped to specific SAP transaction codes (VA01, VL01N, VF01, F-28), providing granular, executable process documentation that mirrors real SAP implementation.

Credit & ATP Controls: The project highlights SAP's built-in controls — credit limit check and Available-to-Promise (ATP) check — which are often overlooked but critical for risk management.

8. Future Improvements

1. Returns & Reverse Process (RE cycle):

Implementing the Returns Order and Credit Memo process to handle product returns and customer refunds, completing the full customer lifecycle management in SAP SD.

2. S/4HANA Fiori Dashboard Integration:

Leveraging SAP Fiori apps to provide role-based, mobile-friendly dashboards for sales managers to monitor order status, delivery performance, and revenue KPIs in real time.

3. Variant Configuration for Products:

Adding SAP Variant Configuration (VC) to allow customers to customize product specifications (size, color, configuration) at the time of sales order creation.

4. EDI/API Integration with Customers:

Automating the O2C process by integrating SAP with customer systems via EDI (Electronic Data Interchange) or REST APIs so that sales orders are created automatically without manual entry.

5. Advanced Analytics with SAP BW/BI:

Connecting the O2C data to SAP Business Warehouse (BW) or SAP Analytics Cloud for advanced reporting revenue forecasting, customer segmentation, and days-sales-outstanding (DSO) analysis.

9. Conclusion

This project successfully documents the end-to-end Order-to-Cash (O2C) business process implemented in SAP S/4HANA for NovaTrade Solutions Pvt. Ltd. The O2C cycle spanning inquiry, sales order, delivery, goods issue, billing, and payment is one of the most fundamental and revenue-critical processes in any trading or manufacturing organization.

By leveraging SAP SD's deep integration with MM and FI modules, NovaTrade can achieve full process automation, real-time inventory visibility, accurate financial reporting, and superior customer service. The use of standardized SAP transaction codes ensures the process is scalable, auditable, and aligned with global best practices. This documentation serves as both a learning artifact and a practical reference guide for SAP SD implementation, reflecting the understanding gained through the training program.
